

With ransomware and advanced malware attacks occurring at unprecedented frequency, Cyber vaults—also known as Isolated Recovery Environments (IREs)—have shifted from a security best practice to a boardroom mandate across nearly every industry. Organizations now recognize that traditional backups and DR systems are no longer sufficient, as modern threats specifically target and corrupt backup infrastructure to prevent recovery.

However, building an effective Cyber vault is far more complex than simply storing data in a separate location. It requires stringent isolation, immutability, governance, secure operational workflows, and continuous integrity checks. This often demands significant investment, specialized expertise, and round the clock management.

UPC Cyber vault delivers a fully managed, isolated, immutable, and indelible cloud storage target engineered to safeguard mission critical data from ransomware, insider threats, and destructive cyberattacks.

UPC Intelligent Cyber vault

Immutable, Air-Gapped Data Protection for Zero-Trust Recovery

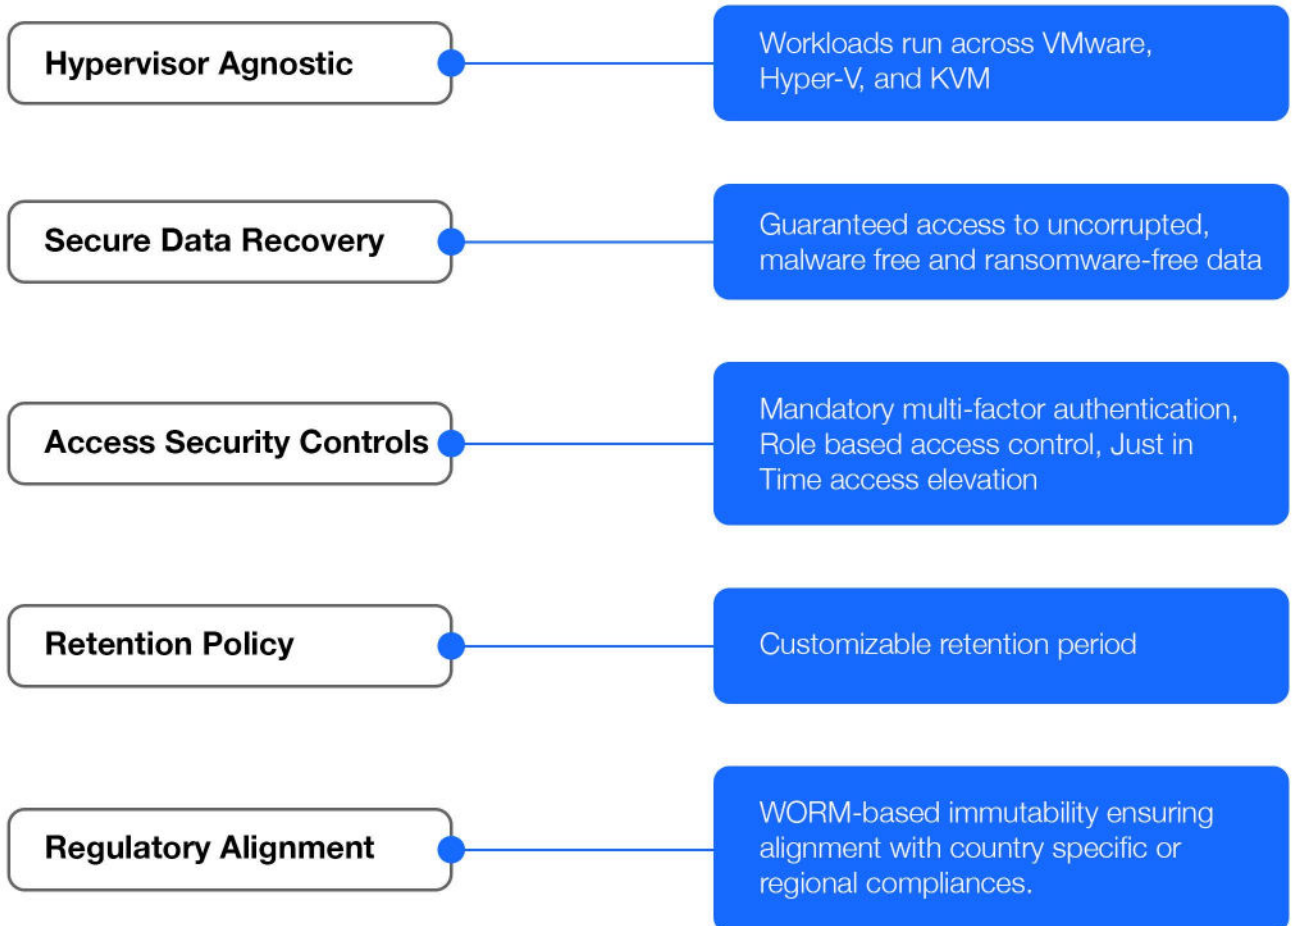

4 Pillars of Unbreakable Security

Powered by United Private Cloud's Intelligent Layer, the UPC Cyber vault provides air-gapped isolation with WORM immutability and AI-driven validation for guaranteed data restoration.

 <p>Air-Gapped Isolation</p> <p>Air-gapped infrastructure with immutable storage</p>	 <p>Immutable Storage</p> <p>Tamper-proof backups that cannot be deleted, encrypted, or modified, even by an admin account.</p>	 <p>Instant Recovery</p> <p>Minimize downtime with policy-driven orchestration that restores data near-instantly.</p>	 <p>Zero Trust Framework</p> <p>Strict identity-based controls and continuous verification—never trust, always verify.</p>
